Abstract

This paper provides a simple example of using the `twocolpaper` document class. The template is designed for academic manuscripts in a compact two-column format. The abstract spans both columns, while the main text is automatically arranged in two columns.

1 Introduction

Two-column layouts are widely used in academic publications because they provide a compact presentation of scientific content. This example demonstrates the basic usage of the `twocolpaper` class.

The document class is based on the standard `article` class and provides a fixed A4 two-column layout. Users can write a manuscript using the standard $\text{\LaTeX}$ commands without having to manually configure the page geometry.

Table 1: Example values calculated from Eq. 1.

a	b	c	x	y
1.0	2.0	1.0	-2	1
1.0	2.0	1.0	-1	0
1.0	2.0	1.0	0	1
1.0	2.0	1.0	1	4
1.0	2.0	1.0	2	9

2 Equation

Consider a simple quadratic function,

$$y = ax^2 + bx + c. \quad (1)$$

For $a = 1$, $b = 2$, and $c = 1$, Eq. 1 becomes $y = x^2 + 2x + 1$.

3 Table

Table 1 gives several example values calculated from Eq. 1.

Figure 1: Example figure.

4 Figure

Figure 1 illustrates an example figure placeholder.

5 Citation

Mathematical typesetting and document preparation are important components of scientific writing [1].
